

Next Phases

1. Multi-User Capability

- a. Want to get it done before the end of July
- b. This would allow for multiple users to be competing in the same “market.”
- c. Markets could have 6-15 people
- d. Each Market would exist independently of all others. You would only be able to view and interact with your market
- e. For testing purposes, I only need one market for my beta group of users
- f. Each user will have the same setup as me, excluding the settings. (i.e., I am the admin)
- g. Draft Day
 - i. Each player starts with 100 dollars as normal
 - ii. The draft order will be random
 - iii. When it's that player's turn, they can pick **one** of the available stocks across all teams
 - iv. At any point, a player can lock in their picks and they will end their draft
 - v. However, players can continue to spend until they don't have enough money to buy any more shares
 - vi. Once all players are unable to spend or have locked in their picks, the portfolios are locked in for the first week
- h. Weekly Buy and Sell
 - i. Instead of being able to buy and sell at will, now you have to make those adjustments in a queue
 - ii. If a user would like to request a purchase or sell, those moves are instead added to a queue
 1. Each buy and each sell is considered a unique move
 2. A player will likely request multiple moves
 - iii. Provide an additional option in the simulation next to the Advanced Week called Execute Queue. Selecting this will execute each player's queues in order
 - iv. The player's queues will be determined by portfolio value. The lowest value executes their **first** request, then the second lowest value executes their **first**, and so on until all records have either failed or succeeded
 - v. A record could fail as a result of the following. If they fail, provide the reason and ensure that the request does not take place
 1. Not enough funds
 2. Shares unavailable
 - vi. All player queues should be kept private, but a new page organized by week should show how the execution took place with a success or failure (along with a failure reason)
 - vii. The maximum number of requests a player can make in a week is 10. Each request can interact with a maximum of 1 share. We should validate

that the buying or selling of a share is valid, given all the other requests (i.e., they have enough funds)

- i. What kind of security implications should we consider?
 - j. Should we review all the code up to this point for efficiency? Explore other options?
2. Real Time Integration
- a. Want to get this done by the end of September, before the season starts
 - b. We would want to link up with KenPom for a live feed that updates at 6 AM each day with new:
 - i. Adjusted efficiency for all teams
 - ii. Schedules (Last 5 and Next 5)
 - iii. Dividend accomplishments - those we might have to get somewhere else
 - iv. Overall records
 - v. We would also want to recalculate shares available and price as well
 - c. Instead of having the simulation years and data that would obviously go away
 - d. Once a week, on Monday at 6 AM, we would execute the player queues for the coming week
 - e. What kind of security implications should we consider?
 - f. Should we review all of the code before this point for efficiency? Explore other options?
3. Mobile Application
- a. I want to bring the web application to Android and iOS
